

Suggested simulation for Ultrasound

There are a number of pre-existing simulation scenarios during which ultrasound would be very valuable including **obesity in pregnancy** and **maternal cardiac arrest**.

Individualised learning for this topic may take on many forms

- Understanding the machine itself which could include self-certification for safe use of the machine
- Use in conjunction with part task trainers for CVP lines, peripheral cannulation, epidural / spine sonography, gastric and airway sonography
- Incorporation of US during MDT drills where learners can be shown ultrasound images to aid in diagnosis and management

It could even form a part of a QI project if US equipment is not available in your department. Look at the learning zone topic for national guidance on the use of US to support your case.
