Dear Colleague,

Published research\textsuperscript{1234} suggests there is a wide range of regimens employed to facilitate analgesia in the postoperative period following Caesarean section.

We would be grateful for a few minutes of your time to complete a questionnaire for our ‘Caesarean Section Analgesia Survey’. This aims to study the current practices employed in providing postoperative analgesia for Caesarean section.

Techniques vary in providing anaesthesia for Caesarean section and especially in the way analgesia is managed in the postoperative period. We are particularly interested in the use of epidural and spinal analgesia in the postoperative period after Caesarean section.

For convenience, completion of this survey involves accessing the following web link on the Internet – \texttt{http://www.anaestheticsurveys.co.uk/obstetric/}

We would be most grateful if you could complete this \textbf{ONLINE} questionnaire. Where practice differs within departments regarding postoperative analgesia for Caesarean section, we would urge you to encourage your colleagues to also follow the web link and complete the survey.

Thanking you in advance for your help with this survey.
